FinTrust | Duplicate handling

Release 1 | Planning and design evidence | 12 October 2026

Duplicate protection protects the ledger. Duplicate-charge detection protects the customer. Same source identity with changed facts is quarantined; distinct genuine transactions are kept and assessed.

Case	Outcome
Same exact file	Audit replay; view original batch; no second processing.
Same row in one file	Keep first accepted event; record repeat occurrence.
Same row in another file	Process other rows; repeated event gets no second ledger entry.
Same identity with changed facts	Quarantine conflict; no silent acceptance or overwrite.
Similar event with a different identity	Keep both valid events; assess possible duplicate-charge risk.
