FinTrust | Database / ERD

Release 1 | Planning and design evidence | 12 October 2026

17 physical tables and two derived views, verified locally on PostgreSQL 16.15. Solid connectors are actual foreign keys. PK / FK / UK mean primary / foreign / unique key. Composite markers apply together. Larger A3 page preserves readable keys.

Physical schema guardrails

Two views are derived, not tables: batch_reconciliation and quarantine_workflow. Transactions.batch_id is lineage rather than a foreign key. Conditional source/account/transaction identity is unique; fingerprints are not globally unique.

Users/roles remain in the local identity registry; browser notices are session state. Neither is an invented SQL entity. S3 payloads and DynamoDB projections are external storage, not relational tables.
